PROFILE

I am a results-driven Software Engineer transitioning into Data Science and Machine Learning. I am currently pursuing an MSc in Advanced Data Science at the University of Exeter. I have 5 years of industry experience including software engineering at Capgemini and data engineering with SQL-based pipelines. I am comfortable working across the full data lifecycle, from data ingestion and transformation to model development and deployment. Actively building Python and ML skills through academic projects and self-directed learning.

EDUCATION

MSc Advanced Data Science · University of Exeter *Jan 2026 – Jan 2027 (In Progress)*

- Coursework spanning Machine Learning, Computer Vision, High Performance Computing and Natural Language Processing.
- Applying Python (scikit-learn, pandas, NumPy) to data analysis and modelling projects.
- Expected graduation: January 2027.

BE Computer Science Engineering · SVITS, Indore *June 2015 – May 2019*

- Major project: Driver Drowsiness Detection System — computer vision alert system to minimise road accidents.
- Minor project: Smart Travel using Fingerprint and RFID for contactless public transport payment.

WORK EXPERIENCE

Associate Consultant · Capgemini *July 2021 – Dec 2025*

- Engineered automated data pipelines using Spring Batch for daily client-side processing workflows, ensuring data integrity and reliability at scale — directly applicable to ML training and data ingestion pipeline design.
- Developed and automated BDD test scenarios using Serenity for Java-based financial services (Discover), improving test coverage and deployment confidence.
- Collaborated with cross-functional client teams to translate business requirements into technical solutions, demonstrating the communication and stakeholder skills required in applied ML roles.

Full-Stack Developer · DigiAppFoundry *Feb 2021 – May 2021*

- Built RESTful APIs in Spring Boot with JWT-based security, reducing unauthorised access and improving system integrity.
- Optimised database query performance by identifying redundant calls and restructuring validation logic, improving application response times..
- Contributed to an inventory management portal with full transactional API support.

Data Engineer · Conflux Technologies *Nov 2019 – July 2020*

- Designed and maintained SQL-based data workflows (Oracle, MySQL) for a fintech lending product (Finflux), supporting data-driven decision making for financial clients
- Performed structured data audits — identifying, correcting, and documenting data quality issues — a core skill in ML feature engineering and data preparation
- Supported client onboarding by configuring product workflows and validating data integrity across large datasets

SKILLS

Programming Languages: Python (scikit-learn, pandas, NumPy), Java, Spring Boot, SQL (Oracle, MySQL), HTML5, CSS, JavaScript

Data & ML: Machine Learning, Statistical Modelling, Data Pipelines, Feature Engineering, Data Visualisation

Tools & Platforms: Git, Linux (Ubuntu), IntelliJ, Postman, Jupyter Notebook

Soft Skills: Cross-functional collaboration, stakeholder communication, problem-solving, agile delivery

PROJECTS

ECG Heartbeat Multiclass Classification · MSc Coursework Project

2026

- Designed and trained a 1D Convolutional Neural Network (CNN) to classify ECG heartbeat signals into multiple cardiac categories, achieving 97% accuracy.
- Applied comprehensive data preprocessing including shuffling and class balancing to ensure robust model generalisation across imbalanced medical data.
- Used K-Fold cross-validation with hyperparameter tuning to optimise model architecture, prevent overfitting, and validate performance reliably.
github.com/BhaveshBhargy/ecg-heartbeat-classification

California Housing Price Prediction · MSc Coursework Project

2026

- Trained and compared four ML models — Linear Regression, Random Forest Regressor, SVR, and MLP neural network — to predict median house values on the California Housing dataset.
- Built a full preprocessing pipeline including feature scaling, one-hot encoding, and missing value imputation using scikit-learn.
- Achieved an R^2 score of 0.80 with the best-performing model, benchmarking all approaches against each other to justify model selection
github.com/BhaveshBhargy/california-housing-prediction

Credzy – Merchant Offers Platform · Personal Project

2022

- Designed and built the backend service for an online merchant offers aggregator using Spring Boot, with front-end contribution — showcasing product-oriented development experience.

Driver Drowsiness Detection System · Academic Major Project

2019

- Built a real-time computer vision alert system to detect driver fatigue and trigger warnings, reducing road accident risk — an applied ML classification problem.

CO-CURRICULAR & LEADERSHIP

- Member of Startup Weekend Indore (2017–2018) — collaborative entrepreneurial environment with rapid prototyping and pitching.
- Organising Head for three major college events (orientation, cultural, farewell) — demonstrated leadership and coordination skills.
